

Job Application Agent

Find better roles, apply with verified facts, and learn from outcomes

ONE VERIFIED RÉSUMÉ · PRIVACY-FIRST · PAUSES ON ANYTHING SENSITIVE

This is an agent skill that discovers roles, checks you're actually eligible, fills out applications using facts it can verify from your résumé, and tracks every submission so nothing gets applied to twice. It's built for your own job search only — not for volume-spamming applications on someone else's behalf.

01 Check requirements

You'll need Node.js 20 or newer, and a coding agent that can control a browser.

02 Install it

```
npx job-application-agent@latest install
```

03 Onboard your résumé

Tell your coding agent:

```
Use job-application-agent to onboard my résumé and job preferences.
```

This is the one and only résumé it will ever use — every application gets filled from these verified facts, not improvised or padded per-listing.

04 Everyday commands

Once onboarded, just talk to it naturally:

<code>search jobs</code>	Find new roles matching your saved preferences
<code>apply <url></code>	Apply to one specific posting
<code>apply all relevant from thread</code>	Apply to every matching job in a list of links

run a round of 10	Work through the next 10 qualifying applications
show attention queue	See what's paused and waiting on you
record outcome ...	Log what happened, e.g. an interview or rejection

05 Choose how much it can do on its own

review-each makes it show you every completed application before it submits. routine-auto lets routine submissions go through on their own, while anything sensitive or judgment-heavy still comes to you. For runs that need to keep going across sessions:

```
echo '{"mode":"routine-auto"}' | node ~/.agents/skills/job-application-agent/scripts/job-application.mjs autonomy grant --stdin
```

Check or pull that back at any time:

```
node ~/.agents/skills/job-application-agent/scripts/job-application.mjs autonomy status
node ~/.agents/skills/job-application-agent/scripts/job-application.mjs autonomy revoke
```

WHAT IT ALWAYS PAUSES FOR

Passwords, SSO, MFA, and CAPTCHA. Legal attestations and government ID numbers. Demographic or voluntary self-identification questions. Anything unclear about work authorization, sponsorship, location, or pay. Any claim it can't verify from your own profile or résumé. It never reads your browser cookies or session files, never bypasses access controls, and never counts a filled-out form as an actual submission.

06 Where your data actually lives

DATA	WHERE IT STAYS
Profile	macOS Keychain or Windows Credential Manager
Résumé + ledgers	Owner-only local state directory
Browser login	Your existing browser session
Skill code	Version-controlled installation directory

Nothing here — your profile, résumé, application history, credentials, or browser sessions — is ever committed to the repository. Anonymous usage analytics are on by default and never include your identity, résumé content, or raw errors; turn them off anytime:

```
node ~/.agents/skills/job-application-agent/scripts/job-application.mjs telemetry disable
```

THAT'S IT — HAPPY BUILDING
